

Report
Of
PYTHON FULL STACK DEVELOPMENT
AICTE – EduSkills Virtual Internship

Submitted To
School of Computer Science and Engineering
IILM University, Greater Noida, U.P.
In partial fulfilment of the requirement of degree of
B.Tech CSE

By
Roll Number of Student: CS - 23411277
Name of Student: PREETI KUMARI
Batch: 2023 – 2027

Candidate's Declaration

I, PREETI KUMARI, do hereby declare that this report is based on my own genuine and sincere work carried out during the AICTE–EduSkills Python Full Stack Developer Virtual Internship, undertaken as part of the requirement for the award of the degree of Bachelor of Technology in Computer Science and Engineering at IILM University, Greater Noida, Uttar Pradesh.

The internship was conducted in virtual mode over a period of 10 (ten) weeks, from January 2026 to March 2026, under the AICTE–EduSkills Virtual Internship Program. This report documents the structured curriculum followed during the internship, the concepts and technologies covered, the practical exercises and assignments undertaken, and the assessments completed as part of the programme.

I further declare that all references used in the preparation of this report have been duly acknowledged, and that the content presented herein reflects my own understanding of the subject matter as developed through the structured learning modules of the internship. I affirm that this report has not been submitted, in part or in full, to any other institute for any other degree or diploma requirement, and I shall be solely responsible for any copyright-related concerns in this regard.

I also undertake that any data, figures, or illustrations reproduced from external sources within this report have been duly acknowledged, and that this document is being submitted purely for academic evaluation as part of the B.Tech CSE programme at IILM University, Greater Noida.

Place: Greater Noida

Date: 29 August 2026

Student Name: PREETI KUMARI

Roll No.: CS - 23411277

Acknowledgement

I take this opportunity to express my sincere gratitude to everyone who supported and guided me throughout the successful completion of my Python Full Stack Developer Virtual Internship. Their encouragement, constructive feedback, and support have been invaluable in shaping this learning experience.

I am sincerely thankful to the All India Council for Technical Education (AICTE) and EduSkills for conceptualising and organising the AICTE–EduSkills Virtual Internship Program, and for providing students like me with a structured, accessible platform to gain foundational exposure to industry-relevant technologies in Python Full Stack Development.

I extend my heartfelt thanks to IILM University, Greater Noida, and the School of Computer Science and Engineering for facilitating this internship as part of my B.Tech CSE curriculum and for encouraging students to pursue skill-based virtual internship programmes alongside academic coursework.

I am equally grateful to the instructors and mentors associated with the EduSkills programme, whose structured modules, recorded lectures, and assessment design made it possible for me to progressively build my understanding from frontend fundamentals to backend development, database management, and version control.

I would also like to thank the faculty members of the School of Computer Science and Engineering, IILM University, for their continued academic guidance and for laying the theoretical foundation that helped me engage meaningfully with the concepts covered during this internship.

Finally, I am deeply grateful to my parents, family, and friends for their constant encouragement, patience, and support throughout the duration of this internship and the preparation of this report.

3. Internship Completion Certificate

This chapter presents the official internship completion certificate issued upon the successful completion of the AICTE–EduSkills Python Full Stack Developer Virtual Internship. The certificate serves as formal proof of participation and successful completion of the 10-week structured programme, undertaken by the student from January 2026 to March 2026, and stands as verifiable evidence supporting the contents of this report.

Figure 3.1: Internship Completion Certificate – Python Fullstack Developer Virtual Internship

4. Internship Description

This chapter presents a comprehensive description of the AICTE–EduSkills Python Full Stack Developer Virtual Internship undertaken by the student as part of the B.Tech CSE curriculum at IILM University, Greater Noida. The internship, conducted entirely in virtual mode, spanned a structured duration of 10 (ten) weeks from January 2026 to March 2026, and was designed to progressively build foundational and practical knowledge across the full spectrum of Python full stack web development.

The internship curriculum was organised in a sequential, layered manner, beginning with the fundamentals of frontend web development and gradually advancing towards client-side scripting, backend programming, web frameworks, relational database management, and finally, version control practices. This progression reflects the natural architecture of a full stack web application, moving from the presentation layer, through interactivity and business logic, to persistent data storage and collaborative development workflows.

The overall technology flow followed during the internship is summarised below:

HTML → CSS → Bootstrap → JavaScript → jQuery → Python → Django → SQL / MySQL → Git & Version Control

The chapter is organised into the following sections: an introduction to the concept of full stack development and the purpose of the internship (4.1); an overview of the internship programme (4.2); the week-wise programme structure (4.3); the internship objectives (4.4); the scope of the internship (4.5); the technologies and tools covered (4.6); the conceptual full stack architecture studied (4.7); the learning methodology followed, including a detailed breakdown of each major technology area (4.8); a week-wise learning journey (4.9); the assessment and documentation practices followed (4.10); the learning outcomes achieved (4.11); and the certificate and internship proof (4.12).

4.1 Introduction

Full Stack Development refers to the practice of working across both the frontend (client-side) and backend (server-side) components of a web application, along with the underlying database that stores and manages application data. A full stack developer is expected to possess a working understanding of how a user's request travels from the browser interface, through business logic on the server, to the database, and back again as a rendered response.

The frontend layer is responsible for everything a user sees and interacts with directly — the structure of a webpage, its visual styling, and its interactive behaviour. The backend layer handles the application's business logic, processes requests, and communicates with the database. The database layer is responsible for the structured storage, retrieval, and management of persistent data. Underlying all of this, version control systems allow developers to track changes to source code, collaborate with others, and maintain a reliable history of a project's evolution.

The purpose of the AICTE–EduSkills Python Full Stack Developer Virtual Internship was to provide students with a structured, self-paced learning journey through each of these layers, using widely adopted, industry-relevant technologies. The internship was designed as a foundational learning experience rather than a live project engagement, with each week introducing a new concept area supported by learning material, hands-on exercises, and assessments.

Through this structured learning journey, the internship aimed to provide practical exposure to the core building blocks of web development — HTML, CSS, and Bootstrap for frontend structure and styling; JavaScript and jQuery for client-side interactivity; Python and Django for backend logic and web application development; SQL and MySQL for database management; and Git for version control. Overall, the internship offered a foundational understanding of how these individual technologies come together to form a complete full stack web application.

4.2 Internship Overview

The table below summarises the key details of the internship programme undertaken:

Internship Program	Python Fullstack Developer Virtual Internship
Organising Body	AICTE – EduSkills Virtual Internship Program
Domain	Python Full Stack Web Development
Duration	10 Weeks
Internship Period	January 2026 – March 2026
Mode	Virtual
Institution	IILM University, Greater Noida, Uttar Pradesh
Student	Khusbu Kumari, B.Tech CSE
Assessment	Weekly / Module-wise Assessments and Final Assessment
Grade	A

The internship covered a broad spectrum of learning areas central to Python full stack development. These included the foundational building blocks of web pages (HTML), visual presentation and layout (CSS and Bootstrap), client-side interactivity (JavaScript and jQuery), server-side programming (Python), a full-featured web application framework (Django), relational database concepts (SQL and MySQL), and collaborative source code management (Git and Version Control).

Each learning area was structured to build upon the previous one, allowing the internship to function as a progressive, cumulative curriculum culminating in a final assessment that evaluated understanding across all of the topics covered during the ten weeks.

4.3 Internship Program Structure

The internship followed a clearly defined week-wise structure, as summarised in the table below:

Week	Topic Covered
Week 1	HTML
Week 2	CSS
Week 3	Bootstrap
Week 4	JavaScript
Week 5	jQuery
Week 6	Python Programming
Week 7	Django Framework
Week 8	MySQL & Database Management
Week 9	Git & Version Control
Week 10	Final Assessment

The curriculum was designed with a deliberate, logical progression. The first three weeks focused on frontend structure and styling (HTML, CSS, and Bootstrap), establishing the visual foundation of web pages. Weeks four and five introduced client-side scripting through JavaScript and jQuery, enabling interactive and dynamic webpage behaviour. Week six shifted focus to backend programming fundamentals through Python, followed by Week seven, which introduced the Django web framework for building structured backend applications.

Week eight covered relational database concepts using SQL and MySQL, equipping students with the ability to design and query structured data stores. Week nine introduced Git and version control, a practice essential to any collaborative software development workflow. The programme concluded with Week ten, a final assessment designed to evaluate cumulative understanding across all topics covered during the internship.

4.4 Internship Objectives

The Python Full Stack Developer Virtual Internship was structured around the following academic and learning objectives:

- To develop a foundational understanding of web development and the role of frontend, backend, and database layers in a full stack application.
- To learn the core concepts of HTML, CSS, and Bootstrap for structuring and styling web pages.
- To gain hands-on exposure to JavaScript and jQuery for client-side scripting and interactive webpage behaviour.
- To develop Python programming fundamentals, including syntax, data types, control structures, and functions.
- To understand the Django web framework and its role in backend web application development.
- To build a conceptual understanding of relational databases using SQL and MySQL.
- To learn the fundamentals of Git and version control for tracking and managing source code.
- To gain practical exposure through structured hands-on exercises and coding assignments in each learning module.
- To successfully complete weekly and module-wise assessments demonstrating understanding of each topic.
- To build a foundational base of knowledge that can support future, more advanced learning in full stack web development.

4.5 Scope of the Internship

The scope of the Python Full Stack Developer Virtual Internship was defined by the structured curriculum provided under the AICTE–EduSkills programme, and was focused on building foundational, conceptual, and practical knowledge across the following areas:

- **Frontend Development:** Understanding the structural and stylistic building blocks of web pages using HTML, CSS, and the Bootstrap framework.
- **Client-Side Scripting:** Learning how JavaScript and jQuery are used to add interactivity and dynamic behaviour to webpages.
- **Python Programming:** Developing an understanding of core Python programming concepts as a foundation for backend development.
- **Backend Development using Django:** Learning how the Django framework structures backend web applications, including URL routing, views, templates, and models.
- **Database Management using SQL/MySQL:** Understanding relational database concepts, table design, and basic query operations.
- **Version Control using Git:** Learning how Git is used to track changes, manage code versions, and support collaborative development.
- **Practical Exercises and Assessments:** Applying concepts learned through hands-on exercises, coding assignments, and structured module-wise assessments.

It is important to note that the internship was structured as a learning and skill-development programme rather than a client-facing or production software engagement. Accordingly, the scope of this report is limited to documenting the concepts studied, exercises undertaken, and skills developed during the ten-week duration, and does not extend to the design, deployment, or maintenance of any commercial or production application.

4.6 Technologies and Tools Covered

The following table summarises the technologies and tools covered during the internship, along with their learning focus:

Layer / Category	Technology / Tool	Purpose / Learning Focus
Frontend Structure	HTML	Structuring the content and layout of web pages using semantic markup.
Frontend Styling	CSS	Styling web pages, including layout, colours, typography, and responsiveness.
Frontend Framework	Bootstrap	Building responsive, mobile-first page layouts using a pre-built component and grid system.
Client-Side Scripting	JavaScript	Adding interactivity, event handling, and dynamic behaviour to webpages.
Client-Side Scripting	jQuery	Simplifying common JavaScript and DOM manipulation tasks.
Backend Programming	Python	Learning core programming fundamentals used for backend application logic.
Backend Framework	Django	Building structured backend web applications using URL routing, views, templates, and models.
Database	SQL	Writing structured queries to create, read, update, and manage relational data.
Database	MySQL	Practising relational database concepts using a widely used database management system.
Version Control	Git & Version Control	Tracking source code changes and understanding collaborative development workflows.

4.7 Full Stack Development Architecture

As part of the internship curriculum, students were introduced to the conceptual architecture of a typical full stack web application. This architecture illustrates how a user's interaction with a web page flows through the different layers of an application, and provided a mental model that connected the individual weekly topics into a cohesive whole. The conceptual layering studied during the internship is represented below:

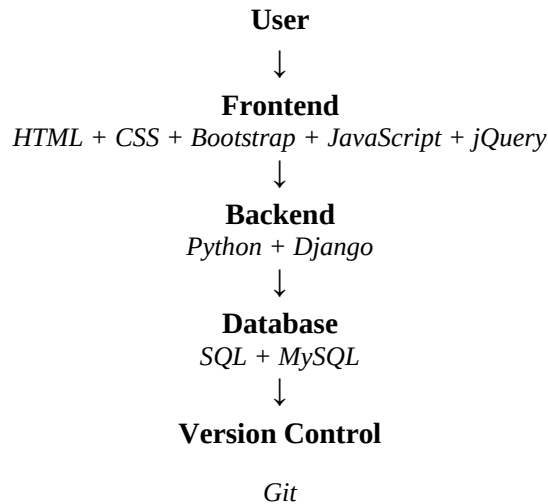

Figure 4.1: Conceptual Full Stack Development Architecture Studied During the Internship

In this conceptual model, the Frontend layer is responsible for presenting information to the user and capturing their interactions through structured, styled, and interactive web pages. The Backend layer, built using Python and Django, processes requests and implements the application's logic. The Database layer, using SQL and MySQL, is responsible for the structured storage and retrieval of data. Finally, Version Control, using Git, underlies all layers by tracking changes to the source code throughout the development process.

It should be noted that this architecture was studied as a conceptual learning framework during the internship, illustrating how the individual weekly topics relate to one another within a complete full stack application. It does not represent a production system that was deployed as part of the internship.

4.8 Learning Methodology

The AICTE–EduSkills Python Full Stack Developer Virtual Internship followed a structured, module-based learning methodology, designed to build knowledge progressively over the ten-week duration. The methodology adopted throughout the internship comprised the following components:

- **Structured Weekly Modules:** Each week focused on a specific technology or concept area, following the defined programme structure outlined in Section 4.3.
- **Concept Learning:** Each module began with the introduction of theoretical concepts and foundational principles relevant to the week's topic.
- **Practical Exercises:** Concepts were reinforced through hands-on exercises designed to build familiarity with the syntax and usage of each technology.
- **Coding Assignments:** Students completed coding assignments to apply the concepts learned in a practical setting.
- **Quizzes:** Short quizzes were used to test conceptual understanding at various stages of the programme.
- **Module-wise Assessments:** Each major topic area concluded with an assessment evaluating the student's grasp of that module's content.
- **Documentation:** Students were encouraged to document their learning and exercises as part of the structured programme.
- **Final Assessment:** The internship concluded with a comprehensive final assessment covering all topics studied during the ten weeks.

This methodology ensured a consistent and cumulative learning experience, with each week's module building upon the concepts introduced in the preceding weeks. The following sub-sections (4.8.1 to 4.8.6) describe each major technology area covered during the internship in further detail.

4.8.1 Frontend Development

The first stage of the internship curriculum focused on frontend development, covering HTML, CSS, and Bootstrap over the first three weeks of the programme.

HTML (HyperText Markup Language) was studied as the foundational markup language used to define the structure and content of web pages. This included learning about common HTML elements, semantic tags, page structure, forms, and how content is organised within a webpage.

CSS (Cascading Style Sheets) was covered as the styling language responsible for the visual presentation of HTML content. This included learning selectors, the box model, layout techniques, colour and typography styling, and basic principles of responsive design that allow web pages to adapt to different screen sizes.

Bootstrap was introduced as a widely used frontend framework that simplifies the process of building responsive, mobile-first web pages. The module covered Bootstrap's grid system, pre-built UI components, and utility classes, which allow developers to construct consistent and responsive layouts more efficiently than writing custom CSS for every element.

Together, these three weeks provided a foundational understanding of how web pages are structured, styled, and made responsive, forming the basis for the interactive and backend concepts introduced in later weeks.

4.8.2 JavaScript and jQuery

Following the frontend structuring and styling modules, the internship curriculum introduced client-side scripting through JavaScript and jQuery over Weeks four and five.

JavaScript was studied as the primary programming language for enabling interactivity within web pages. This module covered fundamental programming concepts such as variables, basic data types, and control structures, alongside browser-specific concepts such as event handling and manipulation of the Document Object Model (DOM). These concepts illustrated how a webpage can respond dynamically to user actions such as clicks, form submissions, and input changes.

jQuery was introduced as a JavaScript library that simplifies many common DOM manipulation and event-handling tasks. The module covered jQuery's simplified syntax for selecting and manipulating page elements, handling events, and performing common interactive behaviours with fewer lines of code compared to native JavaScript.

Together, these two weeks provided a foundational understanding of how client-side scripting brings static web pages to life, enabling dynamic and interactive user experiences.

4.8.3 Python Programming

Week six of the internship shifted focus from the frontend to backend development, beginning with a foundational module on Python programming.

This module covered core Python fundamentals, including basic syntax, variables, and data types such as strings, numbers, lists, tuples, and dictionaries. Control structures such as conditional statements and loops were studied as the building blocks for implementing programme logic. The module also covered functions, including their definition and use in organising reusable blocks of code.

In addition to these fundamentals, the module introduced basic Object-Oriented Programming (OOP) concepts, such as classes and objects, which form an important part of how Python applications — including those built with frameworks such as Django — are structured.

This foundational understanding of Python programming served as an essential prerequisite for the following week's module on the Django web framework, in which these same programming concepts are applied within the context of backend web development.

4.8.4 Django Framework

Week seven of the internship introduced the Django web framework, a Python-based framework widely used for backend web application development.

The module covered Django's core concepts, including URL routing, which maps incoming web requests to the appropriate handling logic; views, which contain the logic for processing requests and generating responses; templates, which are used to dynamically render HTML content; and models, which define the structure of application data and provide an interface for basic interaction with the underlying database.

Through this module, students gained a conceptual understanding of how Django's components work together to structure a backend web application, and how a framework can simplify common backend development tasks such as request handling and basic database interaction.

It is important to clarify that this module provided conceptual and practical exposure to Django's architecture and features through structured learning exercises, and did not involve the design, deployment, or maintenance of a production Django application.

4.8.5 SQL and MySQL

Week eight of the internship focused on relational database concepts, covering both SQL as a query language and MySQL as a relational database management system.

The module introduced the fundamentals of relational databases, including the concept of tables as the primary structure for organising data, and records (rows) as individual entries within a table. Students studied how SQL is used to define, query, and manage structured data through statements for creating tables, and performing basic CRUD (Create, Read, Update, Delete) operations.

MySQL was studied as a practical implementation of a relational database management system, providing hands-on exposure to setting up databases, writing queries, and understanding how data is stored, retrieved, and managed in a structured, tabular format.

This module provided a foundational understanding of database management concepts that are essential to any backend web application, including how the Django framework studied in the previous week interacts with an underlying relational database.

4.8.6 Git and Version Control

The ninth week of the internship introduced Git and the broader concept of version control, an essential practice in modern collaborative software development.

The module covered the purpose of version control systems in tracking changes to source code over time and enabling multiple developers to collaborate on the same codebase without conflicts. Core Git concepts studied included repositories, which store the complete history of a project; commits, which represent snapshots of changes made to the code; branches, which allow developers to work on features or fixes in isolation; and merging, which combines changes from different branches back into a unified codebase.

Through this module, students gained a foundational understanding of how Git is used to track code changes, maintain different versions of source code, and support collaborative development workflows — skills that are broadly applicable across nearly all areas of modern software development.

4.9 Week-wise Learning Journey

This section presents a concise summary of the learning journey undertaken across each of the ten weeks of the internship, following the official programme structure.

- Week 1 – HTML: Introduction to HTML fundamentals, including page structure, semantic elements, and content organisation on the web.
- Week 2 – CSS: Study of CSS fundamentals, covering selectors, the box model, layout, typography, and basic responsive design principles.
- Week 3 – Bootstrap: Introduction to the Bootstrap framework, its grid system, and pre-built components for building responsive layouts.
- Week 4 – JavaScript: Fundamentals of client-side scripting, including variables, control structures, events, and DOM manipulation.
- Week 5 – jQuery: Study of the jQuery library and its role in simplifying common JavaScript and DOM manipulation tasks.
- Week 6 – Python Programming: Foundational Python concepts, including syntax, data types, control structures, functions, and basic OOP.
- Week 7 – Django Framework: Introduction to Django's architecture, covering URL routing, views, templates, and models.
- Week 8 – MySQL & Database Management: Study of relational database concepts, SQL queries, and basic CRUD operations using MySQL.
- Week 9 – Git & Version Control: Introduction to Git, covering repositories, commits, branches, and merging for collaborative development.
- Week 10 – Final Assessment: A comprehensive assessment evaluating understanding of all concepts covered during the internship.

4.10 Assessment and Documentation

Assessment during the internship was conducted on a structured, module-wise basis, in line with the official documentation provided under the AICTE–EduSkills programme. Each major topic area concluded with a corresponding assessment designed to evaluate the student's understanding of that module's concepts.

- Weekly and module-wise assessments evaluating conceptual understanding of each technology area covered.
- Short quizzes used at various stages of the programme to reinforce and test learning.
- Coding and practical exercises requiring the application of concepts learned in each module.
- Assignments designed to build familiarity with the syntax and usage patterns of each technology.
- Documentation activities, encouraging students to record and reflect upon their learning progress.
- A final assessment conducted in Week 10, evaluating cumulative understanding across all topics covered during the ten-week programme.

Successful completion of these assessments, culminating in the final assessment, formed the basis for the overall evaluation of the student's performance during the internship, as reflected in the Grade of A awarded upon completion of the programme.

4.11 Learning Outcomes

Upon completion of the ten-week Python Full Stack Developer Virtual Internship, the following learning outcomes were achieved:

- A foundational understanding of frontend technologies, including HTML, CSS, and the Bootstrap framework.
- An understanding of client-side scripting concepts using JavaScript and the jQuery library.
- A foundational grounding in Python programming, including core syntax, data types, control structures, and basic object-oriented concepts.
- An understanding of the Django web framework and its role in structuring backend web applications.
- A foundational understanding of relational database concepts using SQL and MySQL.
- An understanding of Git and version control practices for tracking and managing source code.
- A conceptual understanding of how frontend, backend, database, and version control layers work together within a full stack web application workflow.
- Improved problem-solving ability and coding practice developed through hands-on exercises and assignments.
- A foundational base of knowledge that provides a starting point for continued, more advanced learning in full stack web development.

These outcomes reflect a foundational and structured introduction to Python full stack development, providing the student with practical exposure and conceptual grounding across the key technology areas covered during the internship.

4.12 Certificate and Internship Proof

The official Certificate of Virtual Internship, issued jointly under the AICTE–EduSkills programme, has been attached in Chapter 3 (Internship Completion Certificate) of this report as formal proof of the successful completion of the 10-week Python Fullstack Developer Virtual Internship, undertaken during January – March 2026.

The certificate confirms that the student, Khusbu Kumari of IILM University, Greater Noida, successfully completed the internship and was awarded a Grade of A. The certificate bears the recognition of the Ministry of Education, the All India Council for Technical Education (AICTE), the National Internship Portal, and EduSkills Academy, and is digitally verifiable via the associated Certificate ID and Student ID.

5. Conclusion

The AICTE–EduSkills Python Full Stack Developer Virtual Internship provided a structured, ten-week learning experience that progressively introduced the core technologies underlying modern full stack web development. Beginning with the foundational frontend technologies of HTML, CSS, and Bootstrap, the internship curriculum advanced through client-side scripting with JavaScript and jQuery, before transitioning into backend development with Python and the Django framework, relational database management with SQL and MySQL, and finally, collaborative development practices through Git and version control.

This structured, layered approach to learning allowed for a cumulative understanding of how each technology contributes to a complete full stack web application, from the user-facing frontend through to the backend logic and persistent data storage. Through hands-on exercises, coding assignments, quizzes, and module-wise assessments, the internship provided practical exposure that reinforced the conceptual knowledge introduced in each weekly module.

Overall, this internship has contributed meaningfully to the student's technical foundation in web development, providing both conceptual understanding and practical familiarity with a broad set of tools and technologies used throughout the software industry. The successful completion of the internship, reflected in the Grade of A awarded upon its conclusion, stands as a foundation for continued learning and skill development in the field of full stack web development.

5.1 Future Scope

While the internship provided a strong foundational understanding of Python full stack development, several areas remain as future learning opportunities that were not covered within the scope of this ten-week programme. The following are identified as future learning areas that the student may pursue to build upon the foundation established during this internship:

- **Advanced Django Development:** Exploring more advanced Django features such as class-based views, middleware, and Django's built-in admin interface.
- **Full Stack Web Applications:** Applying the individually learned technologies together to build complete, independent full stack web applications.
- **REST APIs:** Learning how to design and build RESTful APIs to enable communication between frontend and backend systems.
- **Authentication:** Studying user authentication and authorisation mechanisms for securing web applications.
- **Advanced Database Concepts:** Exploring database normalisation, indexing, and more advanced query optimisation techniques.
- **Deployment and Cloud Technologies:** Learning how web applications are deployed and hosted using cloud platforms and related tools.
- **Git-based Collaborative Development:** Gaining further practical experience with collaborative, team-based Git workflows, including pull requests and code reviews.

These areas are identified as future learning goals, to be pursued through subsequent coursework, self-study, or further internship and project opportunities, building upon the strong conceptual foundation established during the Python Full Stack Developer Virtual Internship.
